Monthly Occupancy Receipts in R

A historical hospitality-data case study

132 records. Twelve months across eleven Year labels.

JAMES OOKO

How do reported occupancy receipts vary by month?

Across the supplied 2011-2021 Year labels, October has the highest monthly median receipts ($78.20 million), while January has the lowest ($46.44 million). These pooled summaries are descriptive, not a forecast.

Method, findings, and limits

Method

Check one record per Month-Year pair and 12 records per Year label. Order months explicitly. Use monthly boxplots and medians to describe the supplied snapshot without assuming a 30-observation rule for histograms.

Checked results

132 records with no missing cells and no duplicate Month-Year pairs. Each month has 11 observations. Occupancy.Receipts is analyzed separately from Occupancy.Tax; neither field is a room occupancy percentage.

Interpretation limits

Some Fiscal.Year labels are inconsistent with the Month and Year fields. The analysis retains the supplied Year labels and does not certify fiscal-year accounting. Raw dollar amounts are not inflation-adjusted; tax rates and economic conditions can vary. Pooling years obscures shocks and trends. This is a local coursework snapshot, not verified current state revenue reporting.
