COMPLETED COURSEWORK / PORTFOLIO REVISION

Transit Ridership in R

MTA data exploration

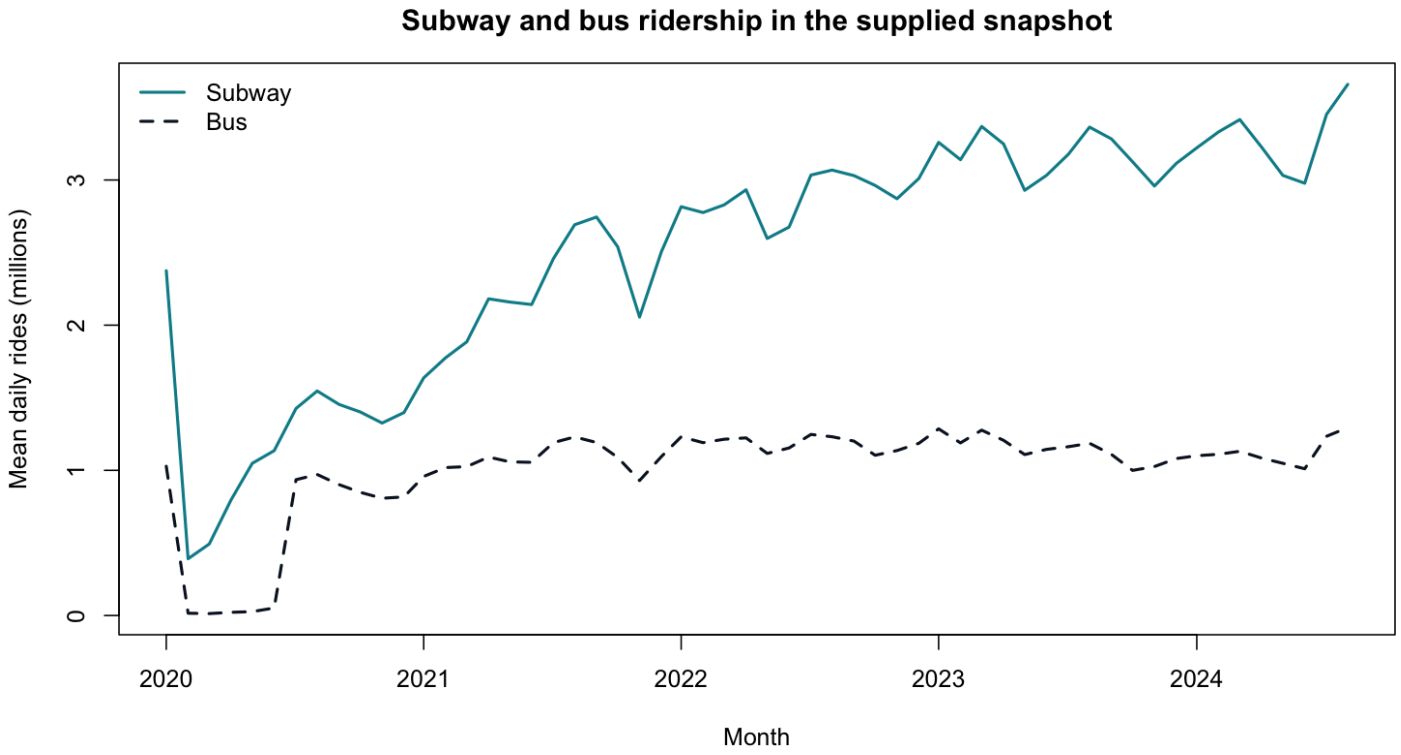

1,706 daily records | Historical snapshot

Actual analysis output | Methods and limits inside

JAMES OOKO

What patterns appear in the supplied MTA snapshot?

The snapshot covers March 1, 2020 through October 31, 2024. Subway monthly mean daily ridership is 0.391 million in April 2020 and 3.659 million in October 2024. These are descriptive endpoints, not a causal comparison.

Method, findings, and limits

Method

Check date uniqueness, missingness, and daily coverage. Summarize each service separately with mean, median, and quartiles. Aggregate all observed days within each complete month for the displayed subway and bus lines.

Checked results

1,706 unique consecutive dates; no missing cells in the supplied workbook. Across the full snapshot, median subway ridership is 2,459,607 per day; median bus ridership is 1,140,776.5 per day.

Interpretation limits

A historical course snapshot, not a live MTA feed. Counts mix weekdays, weekends, holidays, and changing reporting conditions. Recorded bus counts during 2020 need particular care because collection/reporting practices can affect interpretation. Bridge and tunnel vehicle counts are not passenger rides and are never added to transit-service totals. No forecast or causal model is claimed.

Source: MTA Ridership.xlsx, MTA_Data worksheet, supplied with James Ooko's coursework. Public source context: MTA Daily Ridership and Traffic, data.ny.gov. The snapshot is preserved separately from later source revisions.
